Real-Time Air Quality Monitoring Agent

A sophisticated AI-powered system for continuous environmental surveillance and predictive analytics to safeguard public health and inform policy decisions.

Made with GAMMA

Applications & Dataset Overview

Key Applications

- Urban air quality forecasting and early warning systems
- Industrial emission monitoring and compliance verification
- Public health alerts for vulnerable populations
- Environmental policy evaluation and impact assessment

Dataset Characteristics

Comprehensive multi-source dataset spanning 5 years, featuring hourly PM2.5, PM10, NO_2, SO_2, CO, and O_3 measurements from 150+ monitoring stations.

Data underwent rigorous quality control: outlier detection, missing value imputation using forward-fill and interpolation, and normalization for model training.

Made with GAMMA

CNN-LSTM Architecture & Working Principles

1

Convolutional Layers

Extract spatial patterns from multi-sensor inputs, identifying pollution correlations across monitoring locations.

2

Feature Extraction

Compress temporal sequences into meaningful feature representations through learned filters.

3

LSTM Networks

Capture long-term dependencies and temporal dynamics for accurate forecasting.

4

Prediction Output

Generate real-time air quality forecasts with uncertainty quantification.

Results & Performance Interpretation

92%

Prediction Accuracy

Mean accuracy across all pollutants

0.85

R^2 Score

Strong correlation with actual values

15%

Error Reduction

Compared to baseline models

Key Insights

Model excels at predicting PM2.5 and PM10 with 94% accuracy, whilst NO_2 and O_3 show slightly lower performance (88%) due to complex atmospheric chemistry. Forecasts remain reliable up to 24 hours ahead.

Model Limitations

- Performance degrades during extreme weather events
- Limited ability to predict sudden emission spikes
- Requires continuous sensor calibration
- Computational cost increases with monitoring network expansion

Made with GAMMA

Ethical & Societal Benefits

Public Health Protection

Early warnings enable at-risk populations to take protective measures, reducing respiratory illness and mortality rates.

Environmental Justice

Equitable access to air quality information empowers communities to advocate for cleaner environments and hold polluters accountable.

Data-Driven Policy

Accurate forecasting supports evidence-based regulations, emission controls, and urban planning decisions.

> *"This technology transforms how we protect our communities, turning invisible threats into actionable intelligence."*

Live Demonstration

Real-Time Air Quality Monitoring Application

Our web-based platform provides instant access to current air quality levels, 24-hour forecasts, historical trends, and personalized health recommendations based on individual risk factors.

01

Data Ingestion

Real-time sensor feeds from monitoring network

02

AI Processing

CNN-LSTM model generates predictions

03

Visualization

Interactive maps and trend charts

04

Alert System

Push notifications for critical conditions

Try it now: Visit our demo platform to explore live air quality data for your location and receive personalized health guidance.
